FastDB - Fast Pairwise Comparison of Sequences Release 5.4

Results file sq2nsq.res made by on Tue 11 Apr 95 9:41:17-PDT.

Query sequence being compared: US-08-223-263-2 (1-1795)
Number of sequences searched: 57621
Number of scores above cutoff: 4210

Results of the initial comparison of US-08-223-263-2 (1-1795) with: Data bank : N-GeneSeq 17, all entries

The gene was introduced into a plasmid to obtain a recombinant DNA mol. (RGB-1). The DNA sequence was useful in studies of drugs acting on adrenalin receptor subclass beta 1. e.g. dobutamine or prenalterol, or drugs blocking the receptor, e.g. acebutolol, metoprolol, atenolol or DNA encoding adrenalin receptor sub-type beta-1 - obtd. by cloning rat genome DNA library and rat cDNA library with derived from human adrenalin claim 1; Page 5; 8pp; Japanese. The interleukin (II) 9 receptor nucleic acid sequence can be used to produce II-9 receptor or as probes for cells which respond to the cytokine. The complementary sequences can be used to inhibit the expression of the II-9 receptor protein and to probe for the II-9 coding sequences. Transfected cell lines can be used to screen for II-9 receptor agonists and antagonists. Antibodies directed against the II-9 receptor can be used therapeutically to block II-9 binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (LUDW-) LUDWIG INST CANCER RES. Druez C, Renauld J, Van Snick WPI; 93-303390/38.

Residue Identity Initial The lymphokine/cytokine-like proteins are associated with the inflammatory response and/or have mitogenic activities. Antigens raised to the proteins may be useful in detection and purification, especially in bloassays of various tumour cells or genetic defects in the inflammatory response. The best copy of the sequence available is still unclear and some errors in the sequence may occur. US-08-223-263-2 (1-1795) Q05748 EPO recepto 610 CCAGCTTCCT 540 550 560 570 580 590 600 X CATCCCTCCTGG—GCAGAGCTTCTGGAACAGGTCCGTCTCCTTGGGGGCCCTGCAGAGCCTCCTTGGAAC AGTTTAGCCAAAGGATAACTCTCCCCTATG--GGGATGG-TCCACTG-530 540 550 560 570 Erythropoletin receptor and gene - used for developing reagents and systems to control and study erythropolesis.

Claim 7; Fig 2; 53pp; English.

The sequence was obtd. from a clone isolated from a commercially available human geenomic cDNA library in phage Lambda Fix (Stratagene). The sequence encodes a type I transmembrane protein with binding affinity for EPO. The gene and recombinant EPO receptor produced on expression of the DNA are used to develop reagents and systems to control and study erythropolesis. It is believed that the EPO receptor is dysfunctional in individuals with Diamond Blackfan anaemia, and may be hyperactive in polycythemia vera.
See also Q05747 (murine EPO receptor clone).

PS Example 3; Fig 2; 38pp; English.

CC This sequence was obtained by sequencing a cDNA subcloned into an M13 CC Inding vector. The cDNA was obtained by reverse transcribing poly A CC NNA obstained from a phorbol 12-myristate 13-acetate stimulated thuman monocytic cell line U937. This was packaged into a lambda gt10 CC library, which was screened with an appropriate murine cDNA probe.

CC TO screen for human homologues of murine MIP-1alpha, a 236bp KpnI-CC murine MUP-1alpha mature coding sequence. For homologues of murine CC MIP-lbeta 213 bp NcoI-SalI fragment was isolated from pMIP200, which encodes all but the first two amino acids of mature murine CC which encodes all but the first two amino acids of mature murine CC MIP-lbeta 700 CDNA library in lambda gt10. Positive plaques were then subjected to a second round of hybridisation, and it was not possible to distinguish between clones homologous to murine MIP-lalpha WUY2C-1992. 02-APR-1992. 13-SEP-1991; U06489. 13-582636. Claim 11, Fig 9; 83pp; English.

The sequence encodes a protein which regulates the expression of MHC class II genes by binding to DNA sequences which control this expression. The protein causes down-regulation, useful for the prevention and treatment of autoimmune diseases such as Insulin Dependent diabetes, Multiple Scierosis, Lupus Erythematosis and Rheumatoid Arthriris. The protein can also be used for screening and identifying substances capable of inhibiting the expression of the MHC II genes. P-PSDB; R08338 Mach B; WPI; 90-348429/46. /*tag= a WO9012812-A. Polypeptides similar to v-mlp protein of MPIV - treatment of myeloproliferative diseases Claim 10; Page 57-8; 75pp; French. P-PSDB; R27660. for diagnosis

WPI;

92-167154/20.

This nucleotide sequence is one of 6 claimed sequences which code for polypeptides related to MPIV env protein. The proteins have on or more of the following properties: they are involved in the ligand-fixing or signal-transmitting function of haematopoletic growth factor receptors; they are recognised by antibodies to the protein with GENESEQ accession number R23970; when produced from the MPIV genome they can induce/promote proliferation of haematopoletic cells and/or are involved in differentiation of haematopoletic cells. The precise identity of sequence Q24675 is not further described in the specification.

See also R23971 and Q24674-7.

The nucleic acid sequence is derived from the ADMLX gene associated with KS (or Hypogonadotrophic hypogonadism and anosmia).

Oligonucleotide pairs which act as primers for specific amplification of the gene are used in amplification methods to detect genetic anomalies which cause KS. The primer pairs corresp. to the coding and non-coding regions of exon 1 of the ADMLX gene and one pair each for the other 13 exons.
